

RESTAURANT COMMERCE & REWARDS PLATFORM

DAMRU

Digital Commerce & Rewards Platform
Project Overview & Feature Documentation

Website + Mobile Application + Admin Platform

Version	Documentation Date	Prepared For
1.0	7 August 2026	Client & Stakeholders

01 Executive Summary

What Damru is, and the problem it solves for the business.

Damru is an integrated restaurant commerce and customer-engagement platform built for Damru By Namo. It brings together everyday restaurant commerce — browsing the menu, ordering, and checkout — with a full customer loyalty and rewards experience, all managed from one administration platform.

Customers can discover the menu and branches, place orders for delivery, pickup, or right at their table via QR code, manage their profile and addresses, and track their rewards — all from either the website or the dedicated mobile application. Every part of the experience is backed by the same platform, so a customer's Damru balance, order history, and rewards progress stay consistent no matter which device they use.

One Website

Full commerce & account experience, responsive across devices.

One Mobile App

Native iOS/Android experience with matching functionality.

One Admin Platform

Staff manage menu, orders, customers, and rewards from a single dashboard.

At the center of the customer experience is **Damru** — the platform's own reward currency. Customers earn Damru through everyday actions (placing orders, logging in daily, hitting milestones, referring friends) and redeem it directly against future orders. Every reward is issued and validated by the backend, so the balance a customer sees is always accurate and tamper-proof.

Why this matters for the business

A rewards program built this way turns one-time diners into repeat customers — every reward mechanism (streaks, achievements, missions, referrals) is designed specifically to bring customers back and keep them engaged, without requiring a new app release every time a promotion changes.

02 Platform Overview

How the three customer- and staff-facing surfaces share one backend.

The website and mobile application are two independent front doors into the same platform — they call the same backend, follow the same business rules, and show customers the same account, cart, and rewards state. The admin platform sits on top, giving staff a permission-controlled way to manage everything customers see.

Why a shared backend matters

Consistency

A customer's Damru balance, order history, and coupons look identical whether they check the website or the app.

One Source of Truth

Reward eligibility and order rules live in one place — not duplicated (and drifting apart) across two codebases.

Faster Change

A new promotion or reward rule configured once in admin applies everywhere immediately.

03 Customer Journey

The real path a customer follows today, from discovery to repeat purchase.

A customer can also order without creating an account when scanning a table's QR code for dine-in ordering — account creation isn't required for that flow.

04 Customer Account

What a customer can do with their account today.

Registration & Login

Email + password registration and login, with an optional referral code field.

Forgot Password

Email OTP verification followed by a secure password reset.

Profile Management

Name, phone, city, and avatar photo, editable at any time.

Address Book

Multiple saved delivery addresses, added and edited from checkout or the profile.

Order History

Full list of past orders with status and item detail.

Damru Rewards Hub

Wallet, streak, achievements, missions, referrals, and loyalty tier — all in one profile tab.

Occasion dates are protected once set

A customer's date of birth and marriage anniversary — used for birthday and anniversary rewards — become locked immediately after being saved. Changing a locked date requires the customer to contact support, so these dates can't be repeatedly edited to farm rewards.

05 Product & Shopping Experience

How customers discover and choose what to order.

Menu Browsing

Full menu grouped into categories, with a live category filter bar.

Search

Site-wide search across menu item names and descriptions.

Product Variants

Portion size, weight, add-ons, and custom options where a dish supports them.

Pricing & Discounts

Live pricing per variant, with coupon and Damru discounts applied at checkout.

Featured & Suggested Picks

Admin-curated featured dishes and automatically computed best-sellers surface when a customer's cart is empty.

Dine-In QR Ordering

Scanning a table's QR code opens the menu pre-linked to that table for in-restaurant ordering.

Wishlist and personalized recommendation features are not part of the current implementation.

06 Cart & Checkout

From selecting items to placing the order.

The cart lets a customer adjust quantities, apply a coupon code, and see a live price breakdown. Checkout then walks through delivery address selection (skipped entirely for table dine-in orders), an optional Damru redemption against the order total, and a final payment-method choice before the order is placed.

Every price shown to the customer — subtotal, discount, tax, delivery charge, and final total — is independently recalculated and verified on the backend when the order is actually created, so a customer can never be charged an amount the system didn't itself authorize.

Payment collection today

Cash on Delivery is the fully working payment option today. UPI and Card are presented as selectable methods with their own screens, but neither is yet connected to a live payment processor — both currently show a "coming soon" message and direct the customer to choose Cash on Delivery.

07 Order Management

What happens to an order after it's placed.

An order can be Cancelled by staff at any point before delivery. Dine-in table orders use the same pipeline, with the final step relabeled "Served" and no delivery step.

Customers can follow their order's status from their profile at any time. Reaching the **Delivered** state is the single most important moment in the platform — it's the trusted signal that triggers Damru rewards, achievement progress, mission progress, and referral qualification, all at once.

08 Damru Rewards System

The platform's own reward currency, and everything that earns it.

Damru is the platform's internal reward currency — never referred to as "coins" or points anywhere in the product. Customers earn Damru through a wide range of activities, see it building up in their wallet, and redeem it for real discounts at checkout.

Implemented reward sources

Reward	When it's earned
Welcome Reward	Once, on successful registration
First Order Reward	When a customer's first order is delivered
Birthday Reward	Every year, on the customer's date of birth
Marriage Anniversary Reward	Every year, on the customer's anniversary
Account Anniversary Reward	Every year, on the anniversary of joining
Daily Login Reward	Once per eligible day, amount increases with streak
Achievement Rewards	On unlocking a shopping, spending, engagement, or profile milestone
Mission Rewards	On completing a daily, weekly, monthly, or campaign challenge
Referral Rewards	When a referred friend completes their first qualifying order
Loyalty Tier Bonus	Optionally, on upgrading to a higher loyalty tier
Admin Adjustment	Manual credit or debit by an authorized staff member, with a recorded reason

Every reward passes through one controlled engine

Regardless of the source, every single Damru credit or debit goes through the same backend reward engine, is recorded permanently, and can never be issued twice for the same event — even if a request is accidentally repeated.

09 Damru Wallet

Where a customer sees and spends their Damru.

Available Damru
The customer's current, spendable balance.

Lifetime Earned
Total Damru ever credited to the account.

Total Redeemed
Total Damru ever spent on orders.

Transaction History
A full, paginated timeline of every credit and debit, with its source labeled.

Every wallet change is backed by a permanent, timestamped record — nothing is ever silently added or removed. This ledger is what powers the transaction history a customer sees, and what lets support staff investigate any balance question with full confidence.

10 Daily Streak

Rewarding customers simply for coming back.

Customers see their current streak, their longest-ever streak, and exactly what tomorrow's reward will be — encouraging them to keep the chain going. The reward amount for each day in the cycle, what happens after the final configured day (restart, continue, or repeat weekly), and whether a missed day gets a short grace period are all controlled entirely by admin configuration — never hardcoded.

The backend determines eligibility from its own server clock — a customer cannot earn the reward twice by refreshing the page or calling the app repeatedly in one day.

11 Achievements

Longer-term goals that reward genuine engagement.

Shopping
Order-count milestones, e.g. 5, 10, 25, 50, 100 orders.

Spending
Lifetime spend milestones.

Engagement
Login streak milestones.

Profile
Completing profile details.

Loyalty
Account-age milestones.

Each achievement shows its progress toward the goal (for example, "27 / 50 Orders — 54%"), its Damru reward, and a badge once earned. Rewards and badge names are fully configurable by admin — new achievements can be introduced without any app update.

12 Missions

Time-bound challenges that drive short-term repeat purchases.

Example: Monthly Shopper

Place 5 orders this month

3 / 5 completed

Reward: 500 Damru · 12 days remaining

Missions support daily, weekly, monthly, one-time, and limited-time campaign periods — each tracked toward order count, spending amount, login streak, or profile completion, depending on how admin configures it. Progress always comes from the backend; the app never decides on its own that a mission is complete.

13 Referral Program

Turning happy customers into a growth channel.

Every customer gets their own short, shareable referral code and a ready-to-send invite link, with one-tap copy and native sharing on both website and mobile. The reward is **not** issued the moment a friend signs up — only after that friend completes a real, qualifying order, which admin defines by a minimum order value and (optionally) verification requirements.

Built-in abuse protection

- A customer cannot refer themselves.
- Each new customer can only ever be linked to one referrer.
- Rewards for a single referral can only ever be issued once, even if the same event is somehow processed twice.
- Admin can cap the number of successful referrals that earn a reward per customer.

14 Loyalty Tiers

Recognizing a customer's long-term value.

Loyalty tiers give the platform's most valuable customers a clear status and extra benefits — entirely configured by admin rather than fixed in the app. A tier is defined by a name, a qualifying range (based on lifetime spend, completed orders, or lifetime Damru earned — admin picks one method for the whole ladder), a badge, and its benefits.

Bonus Damru Multiplier

Higher tiers can earn Damru faster on qualifying orders.

Exclusive Coupons & Early Access

Tier-specific offers where configured.

Optional Upgrade Bonus

A one-time Damru reward the moment a customer reaches a new tier.

Customers see their current tier, exactly how far they are from the next one, and the full tier ladder — all computed fresh from trusted backend data every time, never estimated on the device.

15 Coupons

Flexible, targeted discounting.

Public Coupons

Available to any customer who enters the code.

Private Coupons

Issued to one specific customer — for example, as a birthday or anniversary reward.

Flexible Discounting

Flat amount or percentage off, with an optional maximum discount cap.

Usage Controls

Minimum order value, validity window, and total usage limits.

A private coupon is only ever visible to the customer it was issued to — it never appears in another customer's coupon list, at checkout, or anywhere else in the product.

16 Mobile Application

A native companion with full feature parity.

The Damru mobile app (built with React Native / Expo) mirrors the website's customer experience closely, screen for screen: home, menu, branches, gallery, and profile as primary tabs, with dedicated screens for authentication, cart, checkout, order history, addresses, and every rewards feature — daily streak, achievements, missions, referrals, and loyalty tier all have their own mobile screens, each with proper loading, error, and pull-to-refresh handling.

Authentication

Register, log in, forgot password, referral code entry.

Shopping & Checkout

Full menu browsing, cart, coupon and Damru redemption, order placement.

Rewards

Wallet, streak, achievements, missions, referrals, loyalty — each with a dedicated screen.

Native Sharing

Referral codes and links share through the device's native share sheet.

17 Admin Dashboard

One control center for the entire business.

Menu & Categories

Full catalog management, including images and pricing variants.

Orders

Live order pipeline, status and payment updates.

Customers

Search, view, and manage customer accounts.

Coupons

Create and manage discount codes.

Branches & Tables

Restaurant locations and QR-code table management.

Reservations & Banquets

Table reservation and banquet enquiry management.

Content

Blogs, gallery, and homepage content.

Rewards & Loyalty

The full rewards program, detailed next.

Staff & Permissions

Admin accounts with granular, module-level access control.

18 Rewards Administration

Full control over the loyalty program, without an app release.

Rewards & Loyalty

- └ Reward Rules (welcome, first order, occasions)
- └ Damru Configuration (redemption rate, limits)
- └ Daily Rewards (streak schedule & behavior)
- └ Achievements (definitions & rewards)
- └ Missions (challenges & periods)
- └ Referrals (qualification & reward rules)
- └ Loyalty Tiers (tier ladder & benefits)
- └ User Rewards (individual customer ledger & manual adjustments)

Authorized staff can inspect any customer's full Damru ledger, unlock a locked occasion date on request, and issue a manual credit or debit — always with a required, permanently recorded reason.

19 Security

How customer trust is protected, in plain terms.

Protected Accounts

Passwords are never stored in readable form; sessions expire automatically.

Server-Verified Rewards

Every reward amount and eligibility check happens on the backend — never trusted from the customer's device.

Duplicate Protection

The same reward can never be issued twice for the same event, even under a repeated or retried request.

Secure Redemption

Damru redemption is tied to a specific, owned order and validated on the backend before any discount is applied.

Private Data Isolation

A customer's private coupons and order data are never visible to another customer.

Permission-Controlled Admin

Every staff action is checked against that staff member's assigned permissions before it's allowed.

20 Platform Benefits

Why this architecture pays off for the business.

Customer Retention Streaks, missions, and achievements are purpose-built to bring customers back.	Repeat Purchases Damru redemption gives every customer a reason to order again.	Personalized Rewards Birthday, anniversary, and milestone rewards feel individually earned.
Referral-Led Growth Customers are incentivized to bring in new customers themselves.	Controlled Promotions Every reward and coupon rule is adjustable from admin — no engineering request needed.	One Platform, Two Front Doors Full web and mobile reach from a single, consistent backend.

21 Current Implementation Status

An honest snapshot of what's live today.

Module	Website	Mobile	Admin	Status
Authentication & Profile	✓	✓	✓	Implemented
Menu, Branches & Discovery	✓	✓	✓	Implemented
Cart & Checkout	✓	✓	Operational views	Implemented — COD only live
Orders	✓	✓	✓	Implemented
Coupons	✓	✓	✓	Implemented
Damru Wallet	✓	✓	✓	Implemented
Daily Streaks	✓	✓	✓	Implemented
Achievements	✓	✓	✓	Implemented
Missions	✓	✓	✓	Implemented
Referrals	✓	✓	✓	Implemented
Loyalty Tiers	✓	✓	✓	Implemented — needs tier configuration
Reservations & Banquets	✓	✓	✓	Implemented
Blogs & Gallery	✓	✓	✓	Implemented
Live Payment Processing	—	—	—	Not implemented

22 Future Opportunities

Realistic next steps — not commitments, not current features.

Live Payment Gateway
Connect UPI/Card to a real payment processor.

Production Analytics
Wire the existing analytics event hooks to a real analytics platform.

Automated Testing
Broader automated test coverage for continued safe iteration.

Richer Notifications
Push and in-app notification delivery for reward moments.

More Loyalty Benefit Types
Expand tier benefits beyond the current set.

Prepared from the Damru repository implementation as of 7 August 2026. Secrets and personal customer data are intentionally excluded from this document.
